At Over 5 Cr Invoices a Month,

SEBI Digital Assurance Review Exposed Material Books-to-Portal Gaps.

Learn how AI-driven control architecture helped a large-format retail enterprise achieve zero books-to-portal gaps.

Enterprise Scale

100+ GST registrations

5 Cr+ sales invoices per month

Multiple POS systems + SAP

10 L+ purchase invoices per month

5–6 day consultant-led reconciliation lag

SEBI Risk Trigger

Digital Assurance readiness review surfaced:

Revenue Variance Across Systems (~5%):

Branch-level B2B uploads from POS systems were not fully synchronised into ERP, creating consolidation gaps. Sales data from POS systems did not map correctly with ERP.

Multi-system data fragmentation:

Three independent billing ecosystems operated without a unified validation layer. No single source of truth before GST return finalisation.

5–6 day manual reconciliation lag:

Reconciliation was consultant-led and performed after data collation. Variances were identified days later, not before filing.

No continuous portal-to-books validation:

GSTR-2B matching and vendor compliance tracking were reactive rather than embedded upstream. Portal data was not reconciled at transaction level in real time.

Under SEBI, these are not routine reconciliation gaps.

They require documented management justification for every variance.

AI-Led Control Architecture

Clear Compliance Cloud rebuilt control around three mandate-critical layers.

1. Integration AI Agent + Recon Agent

Clear established a unified GL-Stream data layer that consolidated POS and SAP data into a single validated source before return preparation.

AI-driven reconciliation logic was deployed to continuously match GSTR-1 with GSTR-3B and GSTR-2B with books, while embedding transaction-level validations upstream to prevent mismatches before filing.

Impact

Revenue variance reduced from

~5% to <1%

Up to 99%

GST reconciliation accuracy

5–6 day

consultant lag eliminated

Real-time

books-to-portal visibility

2. TDS Workbench + Transaction Intelligence

Deployed end-to-end GL extraction with trial balance matching to ensure complete and accurate TDS data capture from source systems.

AI-based TDS section classification and automated PAN, threshold, & rate validations were embedded to align books with TRACES at transaction level before return filing.

Impact

99% Books vs TRACES

reconciliation accuracy

Elimination of

short-deduction exposure

System-supported

Clause 34 exception reporting

3. Advanced 26AS / AIS Reconciliation

Implemented AI-based Many to Many reconciliation between books and 26AS/AIS using cross-FY matching logic to eliminate timing distortions.

Portal validation was shifted from an annual exercise to periodic reconciliation, ensuring continuous credit tracking and alignment.

Impact

90%+

books to 26AS match rate

Tax credit

Improved visibility

The enterprise moved from fragmented reconciliations to continuous AI-validated books-to-govt. portal alignment.

From a SEBI perspective, this enabled:

- System-backed management explanation
- Documented variance tracking
- Transaction-level audit lineage
- Reduced disclosure and governance risk

When management explanation depends on system alignment, spreadsheets are no longer sufficient. Continuous, AI-validated reconciliation becomes financial reporting infrastructure.
