Finance Teams,

Meet TDS Compliance on Autopilot

No manual prep. No rework. Just file.

That's right!

Unlock the playbook to transform
your TDS compliance today.

Own Audits. ✨
The AI Way. ✨

Indian finance teams spend extensive time manually reconciling high-volume TDS data, leading to last-minute challan adjustments, return corrections, and ongoing audit queries. Preparing expense datasets for Clause 34 and Clause 44 and conducting quarterly 26AS reviews also become difficult and delayed, making these processes nearly unmanageable without effective automation.

A Critical Compliance Diagnostic

Ask yourself:

1. Are your teams overwhelmed by repetitive, manual TDS tasks, leaving no time for proactive compliance?
2. Are TDS corrections frequently triggered by section errors or missing information ?
3. Do you face vendor escalations over TDS certificates and mismatches?
4. Are auditors demanding audit trails that your legacy systems simply cannot produce?
5. Is misalignment between your books, and tax records triggering tax notices?

If the answer is yes, you are not alone. Thousands of man-hours are lost annually by most Indian enterprises stuck in error-prone and slow manual TDS workflows, resulting in escalating compliance costs and potential revenue leakages.

Read more to discover the smarter, faster way to TDS compliance, unveiled for the first time.

The CFO Imperative: Proactive Financial Intelligence

The regulatory landscape has shifted. As regulators leverage digital intelligence, your business's tax profile is viewed in totality: direct and indirect tax data are cross-checked, and mismatches across GST, TDS, and ITR entries are flagged automatically.

The imperative is clear: books, GST, and TDS records must be reconciled and aligned prior to filing, not merely after notices land on your desk. Proactive financial intelligence is now a necessity to preempt assessments and automated government queries.

That's where an AI-powered compliance platform comes in. Built to understand intricate TDS accounting logic, spot potential deduction or section mismatches, and self-orchestrate reporting readiness, such technology shifts TDS from being compliance-driven to intelligence-led.

Transformative Outcomes in the AI Era

These are not futuristic possibilities; they are outcomes being achieved today by enterprises that embed AI within their TDS operations:

- Run AI-powered reconciliations with more than 90% accuracy through transaction intelligence and close monthly TDS payable workings in minutes instead of days.
- Auto-prepare government format-ready data sets with zero manual intervention.
- Cut vendor escalations by up to 80% through automated communication and certificate sharing.
- Identify TDS section misclassifications before auditors ever do.
- Maintain a deep audit trail from the first journal entry to the last correction return.
- Cuts Clause 34 reconciliation time from 3 months to just a few hours.
- Achieve end-to-end expense reconciliation across Books, TDS, and GST datasets for Clause 44 reporting.
- Shift from annual to quarterly 26AS reconciliations, increasing the predictability of TDS credits.
- Enable proactive TDS receivable mismatch resolution and save crores in advance tax through timely credit realisation.

The Engine Behind the Outcomes

The underlying technology ensures a compliance ecosystem that continuously interprets, validates, and prepares data required for tax reporting.

Feature	Strategic Capability
AI-Driven Data Reconciliation	Continuously analyses entries across expense and TDS General Ledgers (GLs), links them to Purchase Register (PR) data, and detects discrepancies before they disrupt TDS filings.
Zero-Touch Data Transformation	The system auto-formats all variables: Deductee details, sections, Lower Deduction Certificate (LDC) limits, reversals, and provisions, producing ready-to-file data instantly.
Smart Section Recognition	Transaction-level algorithms analyse vendor and expense history to accurately validate TDS sections. It flags edge cases, refines its logic from past corrections, and automates classification to reduce errors and accelerate reliable reporting.
Audit-Ready Traceability	AI creates a system of record for TDS data, mapping every deduction within the original return and correction to individual GL entries through precise data matching and continuous validation, creating a real-time, audit-proof trail.
Expense Rationalisation for Clause 34	Simplifies reconciliation by combining expense data (invoices, advances, provisions) with real-time checks on PAN, LDC, and threshold limits. Detects and flags discrepancies, accelerating the closing process from months to hours.
Comprehensive Mapping with GSTR-2B Data	Enables complete expense lineage, linking data from GL entries to GSTR-2B, automating reconciliation for Clause 44 and audit reporting, eliminating spreadsheet dependency.
Seamless TDS Credit Matching	Applies best-fit logic, automated PAN-TAN mapping, many-to-many matching, and cross-year comparisons to map every TDS receivable entry against 26AS records with precision.

The CFO's Payoff

When TDS transitions from fragmented processing to unified intelligence, finance leaders regain control over two core assets: Time and Money.

They gain:

- Continuous visibility into every rupee deducted or receivable.
- Confidence that reports presented to auditors, boards, or regulators are backed by complete data traceability.
- Faster closures and cleaner reconciliations every month and quarter.
- Minimised reliance on manual processes and spreadsheet-based workflows.
- Assurance that compliance accuracy keeps pace with business scale.

In short, TDS becomes predictable, transparent, and audit-ready, all driven by the intelligence of AI

The shift has already begun. CFOs adopting systems like the Clear Finance Cloud for Compliance, featuring GL-Stream technology, are no longer reacting to compliance delays; they are proactively governing them. Dashboards flag errors before they turn into audit queries, reconciliations run continuously, and filings move seamlessly from ledger to tax portal.

This is the new benchmark of tax governance: *A future where accuracy, auditability, and agility coexist, and AI makes it possible.*
