

Global e-Invoicing Vendor Evaluation Framework

8 questions to ask every shortlisted e-invoicing provider.

You have seen the vendor demos. Now ask the questions they are not expecting.

Introduction

Most e-invoicing evaluations run the same way: the coverage slide, the integration diagram, the customer logos, a proposal, a follow-up call. Six months after go-live you learn that the certification in a key market sits with a local partner, that schema updates need a three-week change request, or that 24/7 support routes to a pooled offshore team with a 48-hour SLA while a real-time clearance mandate rejects your invoices at scale.

The problem is not that CFOs, Tax Heads, and CIOs ask the wrong questions. It is that the standard process rewards polished answers to predictable questions. Vendors have answered "what countries do you cover" and "do you integrate with SAP" a thousand times. What separates a vendor who holds up when your next mandate goes live from one who creates a crisis is a different set of questions: what happens when something breaks, who absorbs the regulatory change workload, what the certifications require as evidence, and what the real five-year cost looks like at your volume.

Eight questions follow, each with the angle that matters to the CFO, the CIO, and the Tax Head. The vendors who answer them well are worth shortlisting. The vendors who deflect, qualify, or defer are telling you something.

Pricing transparency runs through all eight. Treat a vendor who cannot give a fixed, all-in commercial model, with per-transaction fees, country add-ons, and exception-handling costs included, with the same caution as one who cannot state an SLA.

What This Framework Does Not Cover

It covers vendor evaluation criteria only, not mandate timelines, country sequencing, or build vs. buy. It assumes you have mapped your mandate footprint, decided that independent compliance SaaS is the right architecture, and had the internal readiness conversation. If not, start with the checklist on the next page.

Disclaimer. This framework is published by ClearTax. The eight questions are designed to be asked of any e-invoicing vendor, including ClearTax. Our own answers appear in the final section. Evaluate them with the same scrutiny you would apply to any other provider.

How to Use This Guide

- 1 Read the introduction once. It explains why standard evaluations fail.
- 2 Complete the internal readiness checklist on the next page before any vendor conversation.
- 3 Take the eight questions into every vendor meeting. Share the relevant angle with your CIO and Tax Head so each function knows what to listen for.
- 4 Use the scoring table to compare answers. The consequence notes tell you what a low score means in operational and financial terms, not just evaluation terms.

Before You Start: Internal Readiness Checklist

These five questions are for your own organisation, not the vendor. An evaluation that begins without clear answers stalls at decision points that have nothing to do with vendor capability. Resolve them first.

1. Current ERP landscape and versions?

WHY IT MATTERS

Connector certification is version-specific. A connector certified for SAP S/4HANA does not automatically cover ECC. Without exact versions you cannot test a vendor's integration claim.

IF UNCLEAR

Get a confirmed inventory from IT before shortlisting. A vendor who cannot confirm your version is covered natively is not yet qualified.

2. Who owns compliance governance, and do they hold a budget?

WHY IT MATTERS

E-invoicing sits across Finance, Tax, IT, and Legal. If ownership is unclear, implementation stalls at every decision point and meetings will not convert.

IF UNCLEAR

Agree an owner and decision-maker before conversations begin. Otherwise the evaluation is advisory, not conclusive.

3. Quality of master data across ERP instances?

WHY IT MATTERS

Real-time validation rejects invoices with wrong tax IDs, mismatched entity names, or invalid addresses. Issues invisible today become rejections and payment holds the day a clearance mandate goes live.

IF UNCLEAR

Commission a data-quality assessment as a parallel workstream. Do not wait for go-live to find the gaps.

4. Dedicated budget for implementation and run?

WHY IT MATTERS

Implementation, per-transaction fees, country add-ons, and support vary widely. You cannot compare total cost of ownership without an envelope to measure against.

IF UNCLEAR

Set a budget range before evaluation. Even a rough envelope filters vendors whose pricing model is structurally incompatible.

5. Who signs the MSA, and what is the approval path?

WHY IT MATTERS

Contracts at this scale need legal, procurement, and finance sign-off. An unmapped chain can leave a chosen vendor in contracting for months as mandate deadlines close in.

IF UNCLEAR

Map the approval chain now. Identify the longest lead-time step and start it in parallel with evaluation.

The Eight Questions

01 RELIABILITY

When invoices get rejected, who fixes it, and how fast?

CFO: What is the cost of downtime, and who bears it? **CIO:** Is remediation automated or manual, and what is the contractual SLA? **Tax:** How does unresolved rejection create penalty exposure, and what is the audit trail?

RED FLAG

"Our team will work with you to resolve rejections."
No written SLA. Ownership deflected to an SI partner or your team.

GOOD ANSWER

"Automated retry fires within 60 seconds. Critical failures escalate to engineering within two hours. Here is the SLA and the credit if we breach it."

Scored 1-2: your team owns remediation. At 10,000 invoices a day and a 1% rejection rate, that is 100 transactions daily in commercial limbo – each a potential penalty clock.

02 COMPLIANCE

As regulations mature, who updates your setup, and how soon?

CFO: If a mandate changes at 48 hours notice, what is the vendor's obligation and what does lateness cost us? **CIO:** Are updates automatic, and what is the deployment SLA? **Tax:** What is the track record on past mandates?

RED FLAG

"We monitor all regulatory changes and update accordingly." No SLA. Track record offered as reassurance, not dated examples.

GOOD ANSWER

"Schema updates deploy automatically within 48 hours of government publication." Dated examples: Poland KSeF Feb 2026, Belgium B2B Jan 2026, plus advance-notice commitment.

Scored 1-2: your IT team absorbs every schema update on the government's timeline. A missed update can invalidate every invoice until the fix ships, with penalties accruing on each one.

The Eight Questions

03 IMPLEMENTATION

Can you pull from every source without missing a transaction?

CFO: What transactions are invisible to the compliance layer, and what is the audit penalty exposure? **CIO:** Which ERP versions are natively covered, and what is the architecture for non-ERP sources? **Tax:** How is a missing transaction detected before the authority finds it?

RED FLAG

"We support SAP." No version specificity. Non-ERP sources handled via custom development quoted separately. No missing-transaction detection.

GOOD ANSWER

Certified native connectors for SAP S/4HANA 2023/2022 and ECC 6.0. Non-ERP sources via REST API. Missing-transaction detection runs continuously and alerts before a window closes.

Scored 1-2: invoices from non-ERP sources are invisible to the compliance layer. In a clearance model they do not legally exist until submitted – the authority's matching finds the gap before you do.

04 SUPPORT

After go-live, who do we call, and what is the realistic SLA?

CFO: When something breaks at midnight in a clearance cycle, is a person with authority reachable within the hour? **CIO:** What is the escalation path to engineering, and the SLA at each tier? **Tax:** Does support have real tax expertise, or escalate externally?

RED FLAG

"We offer 24/7 support." No tier structure. No escalation path to engineering. Tax questions handled by the same pool as integration tickets.

GOOD ANSWER

Our in-region team covers your mandated jurisdictions. P1 acknowledged in 30 minutes, in engineering within two hours. Your dedicated CSM has a tax compliance background.

Scored 1-2: when a clearance rejection cascades at midnight, no one with authority is reachable in your window. One unresolved overnight event can halt invoicing across a country for the next business day.

The Eight Questions

05 AUDIT DEFENCE

Will you have the trail to defend our numbers to the tax authority?

CFO: If an authority cross-references our submissions, can we produce a complete, time-stamped record per transaction? **CIO:** Is the audit log immutable, with authority acknowledgement tokens? **Tax:** Does the platform reconcile continuously, or only on demand?

RED FLAG

"Full reporting is in the dashboard." No mention of immutability, acknowledgement tokens, or continuous reconciliation. Retention described as a configurable setting, not a jurisdiction guarantee.

GOOD ANSWER

Every transaction carries a tamper-evident log with the authority's acknowledgement token. Reconciliation runs continuously. Retention is committed per jurisdiction – France's 10-year, UAE's 5-year.

Scored 1-2: you cannot produce a complete, tamper-evident record when an authority cross-references submissions. In India, Saudi Arabia, and increasingly France, this is the standard audit trigger, not a theoretical risk.

06 EDGE CASES

How do you handle credit notes and returns without operational drag?

CFO: What is the operational cost of exception handling at our volume, and is it modelled in the TCO? **CIO:** Are credit notes and partial reversals handled natively, or routed to a manual queue? **Tax:** How are cancelled clearance invoices reconciled?

RED FLAG

"Credit notes are supported." No description of how clearance cancellations reconcile against the government's record. Exception handling not in the TCO presented.

GOOD ANSWER

Credit notes, debit notes, and partial reversals are handled natively with automated routing and reconciliation against the government's record, matching the original cleared invoice.

Scored 1-2: exception handling sits with your operations team. At scale, credit notes and reversals in clearance countries create a permanent manual workload and a reconciliation gap that grows with volume.

The Eight Questions

07 GLOBAL EXPANSION

When a new mandate activates, is it a project or a config change?

CFO: What is the cost and timeline to add a country, fixed in contract or a new SOW? **CIO:** One common integration layer, or a separate build per country? **Tax:** How fast is new coverage added, and is monitoring proactive or reactive?

RED FLAG

"We can scope a new country when the mandate is confirmed." Each addition is a new statement of work. No standard activation timeline. Monitoring described as reactive.

GOOD ANSWER

New countries activate on our common integration layer: one API, one contract, one support team. Standard activation is six to eight weeks, with country costs fixed in the master agreement.

Scored 1-2: every new mandate becomes a fresh implementation at full cost and timeline. With Oman, Qatar, and the Philippines firming up, a fragmented vendor model compounds pressure exactly when mandates overlap.

08 DATA SOVEREIGNTY

Can you guarantee our tax data stays within the required jurisdiction?

CFO: Is data residency a contractual commitment with financial consequences, or a policy statement with no enforcement? **CIO:** Does DR and failover enforce residency? **Tax:** Which mandates require in-country hosting, and can it be demonstrated?

RED FLAG

"We take data privacy seriously and comply with all applicable regulations." No contractual residency. DR architecture not described. Residency handled at the policy level, not infrastructure.

GOOD ANSWER

UAE data is hosted in our UAE data centre and never leaves the region, including under DR failover. Committed in the MSA with financial remedies for breach.

Scored 1-2: a DR failover may constitute a regulatory breach in jurisdictions with mandatory in-country residency, including the UAE and Saudi Arabia. The breach can occur silently and surface only in a regulatory review.

Scoring Table

Score each vendor's answer from 1 to 5. Label columns A/B/C with the vendors you are evaluating. A score of 1 or 2 on questions 01, 02, or 05 carries direct compliance risk; a 1 or 2 on question 08 may constitute a regulatory breach where data residency is mandatory.

01 Reliability SCORE A B C Good: Automated retry; sub-4hr SLA contractually committed; vendor owns remediation. Red flag: Vendor escalates to your team; no written SLA; SI partner owns resolution.
02 Compliance SCORE A B C Good: Day-0 or 48hr update SLA; in-house tax team; dated track record. Red flag: No SLA; relies on third-party local partners; updates on request only.
03 Implementation SCORE A B C Good: Native connectors for your exact ERP version; non-ERP covered; missing-transaction alerting. Red flag: One ERP version only; no non-ERP coverage; gaps found post go-live.
04 Support SCORE A B C Good: In-region team; written SLAs at each tier; dedicated CSM with tax knowledge. Red flag: Offshore pooled support; no escalation to engineering; tax handled externally.

Scoring Table (continued)

05 Audit Defence Good: Immutable log with authority tokens; continuous reconciliation; retention by jurisdiction. Red flag: Reporting on request only; no continuous reconciliation; no per-jurisdiction retention.	SCORE A B C
06 Edge Cases Good: Native credit note and reversal handling; automated routing; reconciliation built in. Red flag: Manual queue for exceptions; no native reversal workflow; reconciliation offline.	SCORE A B C
07 Global Expansion Good: New country is config plus integration in weeks; one API, one contract, one support team. Red flag: Each country a new project and SOW; vendor reactive to mandates, not proactive.	SCORE A B C
08 Data Sovereignty Good: Contractual residency; DR enforces residency; dedicated tenant for regulated entities. Red flag: Privacy policy only; failover may cross borders; shared infra with no isolation guarantee.	SCORE A B C

Bringing It Together: How ClearTax Answers

This is not a separate sales argument. It maps ClearTax's capabilities against the same eight questions. Evaluate these answers with the scoring table you would apply to any provider.

01 | Reliability

ClearTax processes over one billion e-invoices a year for 5,000-plus enterprise clients – the scale that proves the infrastructure holds under real-time clearance, high volume, and simultaneous multi-country deployments. Rejections trigger automated retry and escalation under contractually committed SLAs. Uptime SLA is 99.9%, hosted on AWS, OCI, or GCP with local-region deployment per jurisdiction.

02 | Compliance

The regulatory update SLA is day-zero or within 48 hours of a government change, deployed by an in-house team of 100-plus tax experts, not engineers trained on a product. You are notified; you do not build the fix. IRP designation in India, ZATCA accreditation in Saudi Arabia, and PA listing in France are the government relationships behind that cadence.

03 | Implementation

A unified global API architecture. Pre-built SAP-certified native connectors cover S/4HANA and legacy ECC. Oracle Fusion Cloud, E-Business Suite, and Microsoft Dynamics 365 Finance are covered. Non-ERP sources connect via REST API. The compliance layer sits above the ERP, so an ERP migration does not move it.

04 | Support

Local teams in key jurisdictions, not offshore-only. When a clearance rejection cascades at midnight, escalation goes straight to engineering under defined resolution SLAs, with no pooled queue between your business and the fix. The 100-plus in-house tax experts advise on compliance positioning, not just platform operation.

05 | Audit Defence

Every transaction carries a tamper-evident log from creation through government acknowledgement, with timestamps, status codes, and acknowledgement tokens. Every submission requires a human approval step. Books-to-authority reconciliation continuously matches your ledger to the government's copy.

06 | Edge Cases

Credit notes, debit notes, and partial reversals are handled natively, not routed to a manual queue. Exception workflows are automated, with reconciliation of reversals against the government's record built into the compliance layer.

07 | Global Expansion

ClearTax is live across 50-plus countries covering all four CTC models – real-time reporting, clearance, centralised exchange, and decentralised Peppol – from a single operating layer: one API, one contract, one support team. Monitoring runs ahead of implementation, not after.

08 | Data Sovereignty

Data residency is contractually committed and architecturally enforced. Each region runs on dedicated, sovereign infrastructure; UAE data stays in the UAE, India data stays in India. Certifications: ISO 27001:2022, SOC 2 Type II, ISO 22301:2019, GDPR-aligned, SAMA, RMIT, FTA.

Choosing for the Decade, Not the Go-Live

The vendor you pick this quarter runs your invoicing through the next four mandate waves. Pick for the mandate list of 2030, not the mandate list of 2026.

Three tests separate credible vendors from expensive replacements

- 1 Ask for the government accreditation certificate, not the claim.
- 2 Ask for the update SLA in writing, not in principle.
- 3 Ask where your P1 ticket sits at 2am local time.

Vendors who answer in specifics have thought this through. Vendors who answer in adjectives have not.
